SUMMIT AUTOMATION
Bringing Doors to Life!

Project Title: Facial Recognition Solution

Project Summary: The project is ideal for those students who understand mechanical, electrictronics, database development, software engineering and web based monetization of access.

We have access to our existing system and we are looking to add the functionality of developing a facial recognition solution. This is a white slate opportunity for a team to find the best of the best COTS technology while selecting the smallest, sleekest, most powerful solution to trigger our system to open upon recognition of a known face from a programmed database of faces. Also to develop a learn function and store, database to draw upon within our ecosystem, but then allow web interface to manage the database. The ASU team will map out a full facial recognition solution with Summit's assistance.

The ideal outcome is to develop a fully designed and integrated facial recognition solution (hardware and software) with cloud based interactions to store, remove, set parameters of use, etc.

Project Value Proposition: Why do we need this project to go through as an eProject, our Customer base is looking for sleek and impressive solution as a new method of operating their automated door. Total project value in the first year is $500K.

Deliverables:

1) Fully operational facial recognition solution with operational data base
2) Fully encrypted solution to prevent external hacking into the system
3) A secure but safe method of detecting facial images from live persons vs. photos or video footage
4) Functional drawings, schematics, power supplies, wiring diagram, controls schematics, procured items well defined, assembly specifications, operational parameters, etc. (essential)
5) Testing results confirming the system properly works along with any electronic schematics, programming if any, manufacturing processes, assembly processes, along with tolerances – (optional) (while we would like to have a complete turnkey solution, if this project bleeds into another, we just need to know).

Basic Skills Required: Mid to high level of competency/experience level for electrical, systems engineering, programming, CAD modeling and simulation skills.

Specialized Skills Required: The ideal team members will possess the following specialized skills – Systems Engineering, BUS Networking, include CAD, Modeling and Simulation.

Special Requirements: None
